1

SEED VARIETY CHANGER FOR A PLANTER

CROSS-REFERENCE TO RELATED APPLICATIONS

This application is a Continuation Application of U.S. Ser. No. 13/934,647, filed Jul. 3, 2013, which is a Continuation-in-Part Application of U.S. Ser. No. 12/688,935, filed Jan. 18, 2010, now U.S. Pat. No. 8,543,238, issued Sep. 24, 2013, the contents of which are all hereby incorporated by reference in their entirety.

BACKGROUND OF THE INVENTION

This invention is directed to a method and apparatus for 15 changing the seed type on a planter and more particularly to a method and apparatus that improves the ease and precision of changing seed types on a planter.

Devices for changing the seed type on a planter are known in the art. Existing devices have raised the complexity of an 20 operation that is critical to a farm's income. As a result of the complexity, farmers have been less likely to change seed varieties when planting, thus compromising yield opportunities for speed. Most fields have a majority of land that utilizes one variety of seed and other minor areas that require a 25 different seed. In order to encourage farmers to take advantage of the opportunity to increase yield and profits, a device is needed that reduces costs, complexity, and operational hurdles. In addition, with current devices, locating and holding a seed for precise delivery to the ground as the seed, once 30 it leaves a metering device, tends to bounce and/or scatter. Thus, a device that addresses this deficiency is also needed.

Finally, most current devices require the use of GPS to control activation of the meters. Yet in some areas, such as Eastern Europe, GPS technology is not so readily available. ³⁵ Thus, a device that addresses this deficiency is needed in the art.

An objective of the present invention is to provide a device that changes seed variety in a planter in a simple and easy way.

A further objective of the present invention is to provide a 40 device that controls and holds a seed when changing the variety of seed during planting.

A still further objective of the present invention is to provide a device that triggers the change of seed variety during planting without the use of GPS.

These and other objectives will be apparent to one of ordinary skill in the art based upon the following written description, drawings and claims.

SUMMARY OF THE INVENTION

A system for changing seed variety in a planter includes a plurality of row units with each row unit having a plurality of seed meters, Each seed meter is connected to and in communication with a hopper with each hopper contained a different variety of seed.

Positioned below the seed meters is a transport belt that receives seeds from the meters and transports the seeds to a seed tube for planting. In one embodiment a guide is attached to the discharge end of each seed meter to reduce bounce of 60 the seed when received on the belt. Further, to control the position of the seed on the belt, the belt has adjustable lugs, sidewalls, and/or a cover.

To easily switch from one seed variety to another, each seed meter has a switch that is selectively activated and deactivated 65 by a switch actuator that is attached to the belt. Also, the system has a clean out system that uses an existing seed

2

delivery fan to create a vacuum that removes seeds from the belt for storage. Also, a seed carrying system using a bulk seed delivery system such as a Kinze Air Seed Delivery system for a large reservoir of a primary hybrid and one or more 'seed boxes' used on a row unit is described. In this manner a farmer can carry a large amount of seed and multiple varieties as desired without the complexity of multiple bulk delivery system.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 is an end view of a system for changing seed variety for a planter;

FIG. 2 is a side view of a planting system;

FIG. 3 is an end view of transport belt; and

FIG. 4 is a clean out system for a planter.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

Referring to the Figures, a planting system 10 includes an agricultural implement 12 that pulls a planter 14. The planter includes a plurality of hoppers, tanks, and/or boxes 16 that hold different varieties of seeds 18. In one embodiment the planter 14 has a bulk hopper 16A that holds a main seed variety 18A and a plurality of boxes 16B that hold different types of secondary seeds 18B for use with unique ground areas.

The planter also has a plurality of row units 22 with each row unit 22 having a plurality of seed meters 24. The seed meters 24 may be arranged in any manner such as stacked generally on top of one another, in-line with one another or in any other type of configuration. Each seed meter 24 is connected to and in communication with a respective hopper 16 by a tube, hose, or the like 26 such that seed 18 is delivered from the hopper 16 to the meter 24.

Positioned below the discharge of the seed meters 24 is a transport belt 28. The transport belt 28 receives seed 18 from the seed meters 24 and delivers seed 18 to a seed tube 30 preferably positioned at one end of the belt 28. The seed tube 30 delivers seed to be deposited in the ground for planting.

To reduce the bounce of the seed 18 onto the belt 28, a guide 32 is attached to the discharge of the seed meter 24 and positioned above and near the belt 28. The guide 32 is of any shape such as angled, arcuate, or the like and preferably delivers seed 18 in the direction that the belt 28 is moving. Also, preferred is that the guide 32 be adjustable in relation to the belt 28 to accommodate for different planting needs.

To further locate and hold the seed 18 on belt 28, a cover 34 is attached to adjustable sidewalls 36 of the belt 28 which are connected to a belt frame 38 by bolts 40. The belt 28 also has a plurality of lugs or flights 42 that also may be adjustable or can be changed by switching the belt to a belt with a different lug design. At the discharge end of the belt 28, the cover has an end guide 44 that assists in controlling seed drop to the seed tube 30. The cover 34, lugs 42, and sidewalls 36 are all adjusted such that a seed 18 fits comfortably on the belt 28 below the cover 34 and between the lugs 42 so as to hold the seed 18 between the lugs 42. The sidewalls 36 adjust to accommodate different belt widths for different seed types. For example, different belts would be used for wheat or milo as opposed to corn and beans. With these provisions, belt 28 effectively becomes a seed meter.

The transport belt 28 and seed meters 24 are connected to and controlled by a controller 46 having software 48 that actuates and coordinates the operation of the seed meters 24 and the transport belt 28. In one embodiment, the controller
